(54) Title: COINLESS SLOT MACHINE SYSTEM AND METHOD

(57) Abstract

A gaming apparatus which comprises a slot machine (200) capable of accepting either paper currency, preprinted coupons, or cash out slips. The slot machine (200) also includes a printer (208) that prints and dispenses cash out slips which include a bar code representing a unique identification that provides the amount of "winnings". The cash out slips can be scanned into a separate currency dispenser at a cashier's station (300) for receiving currency, either from the dispenser or from an attendant. A central processing unit (100) generates the unique codes for regulating the game to be played, the wager limits of the game and the validity of the free play coupons or the cash out ticket. The above gaming system avoids having to use coins or tokens in the operation of slot machines.

-1-

COINLESS SLOT MACHINE SYSTEM AND METHOD

BACKGROUND

At the current time, gaming apparatus, including slot machines, pin ball machines and other coin operated games, typically use coins to operate the machines. The coins are inserted in a slot in the gaming apparatus and the player then operates the gaming apparatus based on the value of the coins deposited. Some gaming apparatus, rather than dispensing the players winnings after each play, store the value of the winnings and indicate the remaining "credit" of the player. When the player wishes to stop playing, the coins are then dispensed into an external tray of the gaming apparatus. While the present invention is described in relationship to a slot machine, the term slot machine is used to denote any gaming apparatus that receives money in some form and pays out money or credits.

In some instances, such as when the amount of the winnings exceeds the stored coins within the slot machine, an attendant is notified the additional payment is necessary.

The use of coins in the casino operation for the playing of slot machines has presented a great number of well-known problems that over the years casinos have attempted to eliminate. These problems, among others, are: (1) coins take up a lot of space and have to be frequently emptied from the slot machine, requiring the play of the slot machine to be interrupted; (2) a security guard is required to be present, together with someone to physically move the coins to a central location; (3) the coins then have to be separated, counted, stored and rolled for reuse; (4) coins are heavy and bulky. The amount collected in a typical day at an average casino may weight more than two tons; (5) coins are dirty; and (6) coins required to operate slot machines represent an inventory (working capital) need of several million dollars. Each of the above tasks takes a substantial amount of time, resources,

-2-

and costs money. The collecting, counting and depositing of the coins may involve dozens of people.

In addition to the problems with the physical collection of the coins, there are additional problems associated with the operation of slot machines which use coins. The coins take up a lot of space within the slot machines and the slot machines must be designed so as to incorporate space for storing the coins. The use of coins to play slot machines involves a great number of transactions, including getting change for paper currency. The requires numerous change attendants to constantly walk around near the slot machines so that the players do not have to leave the machines. Also containers have to be given to the players for carrying the coins to and from the slot machines. Paper wrappers from the coins are thrown on the ground near the slot machines. Also coins have to be counted by the change attendants after the players stop playing.

There are slot machines that accept coupons or accept paper currency. However, such slot machines also accept coins.

To overcome some of the above disadvantages in using coins for slot machines, there have been a number of attempts to devise a system of money free slot machines.

The principal approach has been to use some form of credit card or debit card having a user identification code that is inserted into the slot machine, and by use of a Central Processing Unit the identification of the user and the amount of credit available to the user is controlled. A debit card is a card issued by a casino based on a prior cash deposit by the player, much in the same way used in some modem subway systems.

One system uses credit or debit cards having a magnetic strip representing a predetermined value, which can be read by a slot machine equipped with a credit card reader, in place of money. The credit card reader is connected to a central processing unit that determines the value of the card and the value of play.

-3-

While the above systems avoid the use of money, they are susceptible to certain abuses which have made them generally unacceptable to the casino industry. Predetermined credit or debit cards are inconvenient and
5 require the casino to establish credit limits for the user, and are susceptible to counterfeiting or use by an unauthorized person. Some identification or other means of assuring the validity of the cards or user is necessary. As
10 a result, these systems do not permit the user to treat the predetermined credit cards as though the cards were money. This changes the gambling habits of the player, which is undesirable.

In the patent to Kapur, U.S. Patent No. 5,119,295 a lottery ticket dispensing apparatus is disclosed which
15 operates by use of paper currency, credit cards or pay slips. The player obtains a pay slip upon payment of money. The pay slip is coded and can then be ??? into its lottery gaming apparatus. The apparatus prints out a lottery ticket, but has no means for printing any slip
20 corresponding to a winning lottery ticket.

SUMMARY OF INVENTION

In the gaming apparatus of the present invention a slot machine which does not use coins is described. Slot machines are typically activated initially by the insertion
25 of coins into the slot machine through a slot, thus the origin of the name "slot machine".

In the present invention no coins are inserted into the slot machine. The slot machine of the present invention includes an optical paper currency reader that is
30 capable of recognizing and validating paper currency and providing the player with the credit corresponding to the value of the currency.

The slot machine of the present invention also includes a bar code reader that can read and validate
35 pre-printed free play coupons, or printed cash out slips previously printed by the gaming apparatus with a bar code representing the value of the coupon or cash out slip. The

-4-

slot machine also includes a printer that prints and dispenses cash out slips having the value of the cash out slip represented by a bar code. The printer is controlled by a Central Processing Unit (CPU) associated with the slot machine.

Each individual slot machine includes a commercially available Universal Interface Board (UIB) that collects the slot machine data, such as the codes from the bar codes and the output of the paper currency reader and formats it and then transmits it to the CPU. The CPU is located in a secured office of the casino. The printed cash out slips can be accepted by the slot machines in order to obtain credit to play the slot machine or can be inserted or scanned into a separate device at the change station to obtain actual currency.

The bar code representing the value of the free play coupon or cash out slip is augmented by a unique control number randomly generated by the CPU in a well-known manner. When the coupon or cash out slip is put into the bar code reader, the CPU verifies the validity of the individual coupons and cash out slips by verifying the unique control number. Additionally, control numbers for free play coupons can be generated externally and then entered into the CPU as a valid code.

The use of the above system in association with electronic gaming machines eliminates the necessity of having slot machines dedicated to a particular amount of wager. At the present time, the typical casino has slot machines that are dedicated to accept only one value of coin. For example, a slot machine may be a 25 cent machine, accepting only quarters; a 5 cent machine; or a dollar machine. It is very time consuming to physically change the slot machine, which may be desirable during a major event or New Years Eve, when slot machines having higher wager limits are desirable. By use of the subject system, it is possible to change the wager limits of any or

-5-

all of the individual slot machines. Thus, the minimum wager of the slot machine can be changed at any time. It would also be possible to allow the player to select the wager limit.

5 This permits the casino operators to increase the usefulness of the slot machines to the casino. Previously one player desiring high wager limits than a companion would have to be separated, since the higher limit machines would be separated from the lower limit machines. The
10 current system permits high limit machines to be next to lower limit machines, since all machines can have the values selected by the player.

 Customers playing machines of different wagering limits may elect to participate in common jack pot. This
15 will eliminate progressive carrousels from competing against themselves within the casino.

 Another feature of the present invention that is advantageous to the casino is the tracking of the amount of use of the slot machines by a particular player. This is
20 important to a casino which frequently provides perks to customers that use the casino to a significant extent. If the amount of dollars that are being played by a player is desired to be tracked, the player can insert a room key, which in the preferred embodiment is in the form of a card
25 which has a magnetic code on it, into the slot machine which would serve to identify the player. The CPU would then store the amount of play, time and/or money, and/or the individual player. The CPU would stop tracking the individual player when a cash out slip was generated. This
30 system provides a complete accounting of customer accounts. Since the room key or card is only used for the identification of the player and not for providing credit, the security difficulties and interference that is experienced with the other proposals described above are
35 not encountered. If no room key or the like is inserted, the slot machine still operates, but the player is not tracked. Other player identification means besides a room key could be used, such as providing a special

-6-

identification card to the player, or have a key pad or the like with the player inserting his identification code. Once a player has inserted an identification card into a slot machine, that player can then be tracked by the
5 insertion of any cash out slip generated by the slot machine for that player. The player would not have to insert the identification card into a slot machine as long as the player has a cash out slip.

At separate locations from the slot machines would be
10 a "Cashiers Station" controlled by the CPU. The Cashiers Stations would not have any gaming function. In the preferred embodiment of the present invention, the Cashiers Station would pay players the value of the cash out slips. However, it is possible for the Cashier Station to provide
15 cash tickets for use in the slot machines in exchange for currency credit card or other cash equivalents. Normally players would deposit paper currency directly into the slot machine and receive a cash out slip for the unused portion and/or winnings at the end of play. In another alternative
20 embodiment, if a player only had coins available, then the Cashiers Station would permit the player to convert the coins to a cash out slip that could be deposited into the slot machine. Having the Cashier Station accept coins from the players would limit the collection of coins to limited
25 locations. Also, since the slot machines would be accepting paper currency directly, many less coins would be deposited in the Cashier Station. The Cashier Station also could accept cash out slips and dispense currency by an automatic money dispenser. Some ATM devices instead of
30 dispensing cash will dispense coupons.

The above described system overcomes the disadvantages of the prior cashless systems. The concern over counterfeiting of individual cash out slips is eliminated because the CPU will be able to keep track of the unique
35 random number for each cash out slip or coupon. When a cash out slip or coupon is entered into the bar code reader, the CPU will determine the validity of the code,

-7-

and if invalid for any reason, such as it already having been used or cashed, the CPU would not give any credit for the cash out slip or coupon and a silent alarm would be used to alert security personnel to go to the specific slot machine when an invalid code was attempted to be used.

In effect, the system of the present invention permits the player to use the gaming machines in exactly the same manner as if the player was using money. This means that the player does not have to change any playing habits, a very significant factor.

OBJECTS OF INVENTION

It is an object of the present invention to provide a gaming apparatus that does not need to use coins;

It is another object of the present invention to provide an improved gaming apparatus that is convenient for the player to use;

It is still another object of the present invention to provide a gaming apparatus that is reliable;

It is a further object of the present invention to provide a gaming apparatus that does not require the player to change his playing habits;

It is yet another object of the present invention to provide a gaming apparatus that can accept preprinted free play coupons;

It is yet another object of the present invention to provide a gaming apparatus that can be use currently commercially available electronic components;

It is yet another object of the present invention to provide a gaming apparatus that increases the usability of the slot machines in the casino;

It is yet another object of the invention to provide controls and accountability far superior to existing devices;

These and other objects of th present invention will be apparent from a review of the following specification and the accompanying drawings.

-8-

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a diagrammatic block diagram of the system of the present invention;

5 Figure 2 is an exemplar of a typical cash out slip from the gaming apparatus of the present invention;

Figure 3 is an exemplar of a coupon capable of being used with the gaming apparatus of the present invention;

10 Figure 4 is an exemplar of a jackpot winner cash out slip from the gaming apparatus of the present invention; and

Figures 5a and 5b are exemplars of typical menu screens capable of being displayed with the gaming apparatus of the present invention.

DETAILED DESCRIPTION OF THE DRAWINGS

15 Referring to Figure 1, the block diagram of the components of the invention are shown. The System 10 comprises components all of which are currently available from existing technology. The system itself is referred to as a Coinless Gaming System and is referred to generally by
20 reference 10.

The Coinless Gaming System is controlled by a host central processing unit (CPU) 100 consisting of a stand along computer having all of the conventional attributes of a general purpose computer. In the preferred embodiment a
25 status brand fault tolerant computer is used. The CPU 100 is connected to a series of gaming apparatus, such as slot machines 200, 200a...n. The play of the slot machine 200 is controlled by internal game software 202 with preset parameters for the play of the game. In the preferred
30 embodiment the desired game to be played is selected from a touch screen operable menu (shown in Figures 5a and 5b) whereby the player can select the particular game that the player wishes to play, as well as other options, such as the amount of the wager. For example, the menu may provide
35 the player with the options of playing blackjack, conventional slots, poker, horse racing, roulette, or any other game available on software. The player can also

-9-

select the amount of the wager, for example in units of 25 cents, \$1.00 or any other amount permitted by the menu. The technology for touch screen menu driven devices is known. Such touch screen of the present invention is sold
5 commercially by Video Gaming Technology, Inc. and others. The CPU 100 controls the various menu driven options, such as game selection and amount of the wager for the game.

The slot machine 200 includes a first input means in the form of a paper currency reader 204. The paper
10 currency reader provides a signal to the CPU 100 indicating that it is valid currency and value of the currency. The CPU then authorizes the appropriate credit to the gaming apparatus. The paper currency reader 204 is well known in the trade and is commercially available from numerous
15 companies, including J.C.M.

While in the preferred embodiment the paper currency reader 204 will be limited to United States paper currency, it is possible to have several different paper currency readers or one reader that recognize a variety of
20 international currencies. The CPU 100 can have the current exchange rates for purposes of determining the credit available to the player.

The slot machine 200 has a second input means in the form of a bar code reader 206. The operation of bar code
25 readers are well known and in the preferred embodiment a bar code reader commercially available from Triad is used. While in the preferred embodiment the bar code is inserted in the form of a permanent storage means, such as on a paper cash out slip, such as shown in Figure 2, or free
30 play coupon shown in Figure 3, or Jackpot pay out ticket shown in Figure 4, each of which has a bar code on the ticket for reading by the bar code reader, it is recognized that other forms of codes can be used in its place, such as coded magnetic strips on plastic cards.

35 While in most cases the free play coupons will be in the form of a monetary value, preprinted free play coupons not having money values associated with them, but other forms of play are possible. For example, the coupon may be

-10-

used to permit the player to compete in a contest for the best hand in a casino wide poker contest, or other promotional purposes.

5 In the preferred embodiment, the paper currency reader 204 and the bar code reader 206 are located within the housing of the slot machine 200 so that the free play coupons, cash out slips and paper currency are all entered within a single slot and stored on top of each other in a single lock box that would be removable from the slot
10 machine by authorized personnel. However, it is also possible to have the paper currency deposited in a separate slot from the free play coupons or cash out slips and stored separately.

The slot machine also includes a bar code printer 208
15 for printing cash out slips 220 having bar codes 222 on a permanent storage medium, such as paper, which is stored within the housing. In addition to the bar code the cash out slip 220 may also contain other information such as the date 224 of the print out of the cash out slip 222. A
20 simple roll of preprinted cash out slips should be sufficient to generate from 400 to 800 cash out slips. A sensor can signal the CPU 100 when only the (10%) percent, or some other amount, of the coupons are remaining so that the paper can be changed. The printer 208 prints a bar
25 code as directed by the CPU 100. Such printers are well known. In the preferred embodiment of the present invention the bar code printer 208 is commercially available from Star Micronics.

The printer 208 prints a bar code 222 on the cash out
30 slip 220 responsive to the instructions from the CPU 100. The CPU 100 generates the bar code to be printed. The bar code 222 represents the monetary value of the value of the credit stored in the particular slot machine 200 on the cash out slips 220, along with a randomly generated number
35 in order to permit the CPU 100 to verify the validity and unique identification of the cash out slip 220 at a later time. This is necessary since the bar code cash out slip 220 is capable of being inserted as an input into the bar

-11-

code reader 206. Upon insertion of the cash out slip 220 into the bar code reader 206, the bar code reader 206 transmits a single to the CPU 100 corresponding to the bar code, and the CPU 100 compares the bar code 222 on the particular cash out ticket with those stored in its memory which contains the value of the cash out slip, the unique identification, and its status. For example, the status may be "paid", in which case the cash out ticket will be considered invalid and no credit will be given for the cash out slip. Since the CPU 100 has randomly generated the unique identification, a cash out ticket can receive credit only once. The options available if the code is invalid are: (1) the slot machine will merely reject the cash out slip if it does not have any readable code, such as would be the case if it was blank paper; or (2) if there is a readable bar code, but one that is an invalid code, security will be called.

In an alternative embodiment of the present invention, when paper currency, a cash out slip or a free play coupon is inserted as an input into a slot machine 200, a status indicator in the form of a visual display of the amount of the value of the ticket, currency or free play coupon will appear on the screen, as shown in Figure 5, with a query to the player to verify that this is the right amount. If it is not the right amount or there is some other error, then the player would be directed to call an attendant.

A third input to the CPU can be a player identification code reader 210 which is capable of reading a room key or specially encoded identification card, such as one having a magnetic strip, for identifying the player using the slot machine 200. This identification card is intended to permit the CPU 100 to keep track of the player and the amount of time and/or money played by the identified player. The identification card is not intended to provide the player with credit so the concern over the security of the card is not significant, as would be the case if the identification card provided the player with credit or was

-12-

used to store the amount of winnings of the card holder.

The identification card reader 210 input can also be a key pad which the player would use to enter a number or some other means of identification. Such key pads are well known and are commercially available.

Also associated with the CPU 100 are one or more change stations 300, 300a...n or convenient ATM 500, 500a...n devices which instead of dispensing cash, generate a coupon usable with the slot machines 200. In the preferred embodiment, the change station 300 consists of a second bar code reader 304 that accepts cash out slips 222. The validity of the cash out slip 222 is verified by the CPU 100, and if valid, paid for by the attendant. Other security devices, such as holograms and the like that can be visually inspected to provide further security may be employed as well.

In an alternative embodiment, the change station can be more automated. The change station 300 in an alternative embodiment consists of a second paper currency reader 302, a second bar code reader 304, and a second bar code printer 306 for printing bar codes on a permanent storage medium. The second currency reader 302, second bar code reader 304, and second bar code printer 306 are the same as used in the slot machine 200. The change station 300 also includes a currency dispenser 308 so that when a cash out slip 222 is inserted into the bar code reader 306, then paper currency and coins can be dispensed directly to the user. In an alternative embodiment, a coin receiver is capable of accepting coins from a player in order to print cash out slips having a bar code, in the same manner that the slot machine 200 would print out cash out slips, that could be used with the slot machines 200.

As is the case with the slot machine 200, in the event that a cash out slip 222 is inserted into the bar code reader 304, the CPU 100 will validate the cash out slip 222 by making sure that it had not already been paid or otherwise valid. If it is valid then the currency would be paid out by the Change Station attendant. The attendant

-13-

could be advised of the amount of currency to be paid to the player by a monitor display or a receipt printer, such is used in cash registers. Such receipt printers are well known.

5 The CPU 100 is fed signals generated by the Universal Interface Board (UIB) 400 which acts as the interface between the slot machine 200 and the CPU 100. The UIB is a commercially available interface which is widely used in the gaming industry to control the operation of existing
10 stand along electronic gaming apparatus. In the preferred embodiment of the present invention, the Universal Interface Board is sold by Five Star Solutions, Inc.

 The UIB consists of an electronic chip which collects all of the slot machine data, organizes and formats it, and
15 then transmits the organized data to the CPU 100. The UIB 400 also acts as a controller for the operation and functions of the bar code reader 206, the printer 208, the paper currency reader 204, the player identification input and other peripherals associated with the slot machines.
20 The UIB 400 is capable of being changed by the CPU 100 to alter any of its functions. Standard computer programming, such as is well known to computer programmers in the gaming industry, is used to select the particular parameters designed to be employed in the operation and control of the
25 UIB 400 and the CPU 100.

 While in the preferred embodiment, printed bar codes are used as the encoding means, it is also possible to use other coding means, such as magnetic codes on magnetic strips on plastic cards. The cards would be treated the
30 same as cash out slips, but would require magnetic code readers and magnetic code generators rather than bar code readers and bar code printers.

 While the present invention has been described in detail with regards to the preferred embodiment, it is
35 appreciated that other variations of the present invention may be devised which do not depart from the inventive concept of the present invention.

-14-

What I claim is:

1. A gaming apparatus that pays credits responsive to the outcome of the game place comprising:

5 a. an electronic memory means for storing the amount of credit available for the play of said game;

b. an input associated with a paper currency recognition means or recognizing and validating paper currency and providing a first input signal to said electronic memory means representing the amount of credit
10 represented by said paper currency;

c. a means for generating a first code on a first permanent storage record means representing credit stored and an outlet for said first permanent storage record means;

15 d. an input associated with a code reading means for reading said first code on said first permanent storage record; and

e. means for providing a signal to said electronic memory means representing the amount of credit represented
20 by said first code.

2. The gaming apparatus of claim 1 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

3. The gaming apparatus of claim 1 in which said
25 means for generating said first code is a bar code printer.

4. The gaming apparatus of claim 1 in which said permanent storage record is paper, said paper being stored in said gaming apparatus.

5. The gaming apparatus of claim 4 in which said
30 paper is stored in said gaming apparatus in the form of a roll.

6. The gaming apparatus of claim 1 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic
35 code reader.

7. The gaming apparatus of claim 1 in which said means for generating said first code is a magnetic code printer.

-15-

8. The gaming apparatus of claim 6 in which said permanent storage record means is a card, said card being stored in said gaming apparatus.

5 9. The gaming apparatus of claim 1 in which said code reading means reads and validates preprinted coded coupons.

10 10. The gaming apparatus of claim 9 comprising a means for determining the validity of said coded coupons and generating a signal to the electronic memory means corresponding to the value of said coded coupons only if valid.

11. The gaming apparatus of claim 1 in which said first code includes a security code portion for the electronic memory means to validate the code of said first storage means.

15 12. The gaming apparatus of claim 11 comprising a means for accepting coded coupons.

13. A gaming apparatus that pays credits responsive to the outcome of the game played comprising:

20 a. an electronic memory means for storing the amount of credit available for the play of said game;

b. a code reader for reading a code on a permanent storage record means corresponding to the amount of credit represented by said code; and

25 c. a means for generating a first code on a first permanent storage record representing the amount of credit stored.

14. The gaming apparatus of claim 13 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

30 15. The gaming apparatus of claim 13 in which said means for generating said first code is a bar code printer.

16. The gaming apparatus of claim 13 in which said permanent output record is paper, said paper being stored in said gaming apparatus.

35 17. The gaming apparatus of claim 16 in which said paper is stored in said gaming apparatus in the form of a roll.

-16-

18. The gaming apparatus of claim 13 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

5 19. The gaming apparatus of claim 18 in which said means for generating said first code is a magnetic code printer.

20. The gaming apparatus of claim 18 in which said permanent storage record is a card, said card being stored
10 in said gaming apparatus.

21. The gaming apparatus of claim 13 comprising a means for accepting paper currency.

22. The gaming apparatus of claim 21 comprising a means for determining the validity of said paper currency
15 and generating a signal to the electronic memory means corresponding to the value of said currency.

23. The gaming apparatus of claim 13 comprising a means for accepting coded coupons.

24. The gaming apparatus of claim 23 comprising a
20 means for determining the validity of said coded coupons and generating a signal to the electronic memory means corresponding to the value of said coded coupons.

25. The gaming apparatus of claim 13 comprising a paper currency recognition means for recognizing and
25 validating paper currency and providing a first input signal to said electronic memory means representing the amount of the credit represented by said paper currency.

26. The gaming apparatus of claim 13 in which said first code is a unique code, representing the value of the
30 amount of credit.

27. The gaming apparatus of claim 26 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

28. The gaming apparatus of claim 26 in which said
35 means for generating said first code is a bar code printer.

29. The gaming apparatus of claim 26 in which said permanent output record is paper, said paper being stored in said gaming apparatus.

-17-

30. The gaming apparatus of claim 29 in which said paper is stored in said gaming apparatus in the form of a roll.

5 31. The gaming apparatus of claim 26 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

10 32. The gaming apparatus of claim 31 in which said means for generating said first code is a magnetic code printer.

33. The gaming apparatus of claim 31 in which said permanent storage record is a card, said card being stored in said gaming apparatus.

15 34. The gaming apparatus of claim 26 comprising a means for accepting paper currency.

35. The gaming apparatus of claim 26 comprising a means for determining the validity of said paper currency and generating a signal to the electronic memory means corresponding to the value of said currency.

20 36. The gaming apparatus of claim 26 comprising a means for accepting coded coupons.

37. The gaming apparatus of claim 26 comprising a means for determining the validity of said coded coupons and generating a signal to the electronic memory means corresponding to the value of said coded coupons.

25 38. The gaming apparatus of claim 14 including an automatic pay-out system comprising:

30 a second code reader for reading said first code on said permanent storage record corresponding to the amount of credit represented by said code;

a means for validating said first code and for providing a first input signal to said electronic memory means representing the amount of credit represented by said code, said electronic memory system generating a second output signal representing the amount of currency to be dispensed;

35 a means for storing currency within said gaming apparatus;

-18-

a recognition means for recognizing and distinguishing different values of currency and for dispensing said currency in response to said second signal from said electronic memory system.

5 39. The gaming apparatus of claim 38 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

40. The gaming apparatus of claim 38 in which said means for generating said first code is a bar code printer.

10 41. The gaming apparatus of claim 38 in which said permanent output record is paper, said paper being stored in said gaming apparatus.

42. The gaming apparatus of claim 40 in which said paper is stored in said gaming apparatus in the form of a roll.

15 43. The gaming apparatus of claim 38 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

20 44. The gaming apparatus of claim 42 in which said means for generating said first code is a magnetic code printer.

45. The gaming apparatus of claim 42 in which said permanent storage record is a card, said card being stored in said gaming apparatus.

25 46. The gaming apparatus of claim 38 comprising a means for accepting paper currency.

47. The gaming apparatus of claim 38 comprising a means for determining the validity of said paper currency and generating a second input signal to the electronic memory means corresponding to the value of said currency.

30 48. The gaming apparatus of claim 38 comprising a means for accepting coded coupons.

49. The gaming apparatus of claim 38 comprising a means for determining the validity of said coded coupons and generating a second input signal to the electronic memory means corresponding to the value of said coded coupons.

-19-

50. The gaming apparatus of claim 38 comprising a paper currency recognition means for recognizing and validating paper currency and providing a second input signal to said electronic memory means representing the amount of the credit represented by said paper currency.

51. The gaming apparatus of claim 38 in which said first code is a unique code, representing the value of the amount of credit.

52. The gaming apparatus of claim 50 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

53. The gaming apparatus of claim 50 in which said means for generating said first code is a bar code printer.

54. The gaming apparatus of claim 50 in which said permanent output record is paper, said paper being stored in said gaming apparatus.

55. The gaming apparatus of claim 53 in which said paper is stored in said gaming apparatus in the form of a roll.

56. The gaming apparatus of claim 50 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

57. The gaming apparatus of claim 55 in which said means for generating said first code is a magnetic code printer.

58. The gaming apparatus of claim 55 in which said permanent storage record is a card, said card being stored in said gaming apparatus.

59. The gaming apparatus of claim 50 comprising a means for accepting paper currency.

60. The gaming apparatus of claim 50 comprising a means for determining the validity of said paper currency and generating a second input signal to the electronic memory means corresponding to the value of said currency.

61. The gaming apparatus of claim 50 comprising a means for accepting coded coupons.

-20-

62. The gaming apparatus of claim 50 comprising a means for determining the validity of said coded coupons and generating a signal to the electronic memory means corresponding to the value of said coded coupons.

5 63. A method employing gaming apparatus said gaming apparatus consisting of:

 a. a game that pays credits responsive to the outcome of the game played, said game associated with an electronic memory means for storing the amount of credit available for
10 the play of said game;

 b. a paper currency recognition means for recognizing and validating paper currency and providing a first input signal to said electronic memory means representing the amount of the credit represented by said paper currency;

15 c. a means for generating a first code on a first permanent storage record representing the amount of credit stored;

 d. a code reading means for reading said first code on said first permanent storage record and means for
20 providing a signal to said electronic memory means representing the amount of credit represented by said first code, consisting of the steps of depositing paper currency or a permanent storage record having a code in the paper currency recognition means or code reading means and upon
25 completion of use of the gaming apparatus generating a first permanent storage record corresponding to the credits available.

 64. The method of claim 62 further including the steps of inserting the first permanent storage record at a
30 remote location in a second code reader means associated with said second code reader indicating the value of the credits.

 65. A gaming system comprising:

35 a. a game that pays credit responsive to the outcome of the game played, said game associated with an electronic memory means for storing the amount of credit available for the play of said game;

-21-

b. a change system for providing currency in exchange for said credits;

c. an input means for receiving a permanent storage record;

5 d. a code reading means for reading a code on said permanent storage record corresponding to the amount of credit represented by said code;

e. a means for validating said code and for providing a first signal to said electronic memory means representing
10 the amount of credit represented by said first code; and

f. a means for storing currency, and a currency recognition means for recognizing and dispensing currency in response to a second signal from said electronic memory means representing the amount of currency to be dispensed.

15 66. A change station comprising an exchange system for providing currency in exchange for credits generating by a game in response to the outcome of the game played comprising:

20 an input means for receiving a permanent storage record;

a code reading means for reading a code on said permanent storage record corresponding to the amount of credit represented by said code;

25 a means for validating said code and for providing a first signal to an electronic memory means representing the amount of credit represented by said first code; and

a means for storing currency, and a currency recognition means for recognizing and dispensing currency in response to a second signal from said electronic memory
30 means representing the amount of currency to be dispensed.

67. The gaming apparatus of claim 65 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

35 68. The gaming apparatus of claim 65 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

-22-

69. The gaming apparatus of claim 67 in which said permanent storage record is a card, said card being stored in said gaming apparatus.

5 70. The gaming apparatus of claim 65 comprising a means for accepting coded coupons.

71. The gaming apparatus of claim 65 comprising a means for determining the validity of said coded coupons and generating a signal to the electronic memory means corresponding to the value of said coded coupons.

10 72. The gaming apparatus of claim 65 in which said first code is a unique code representing the value of the amount of credit.

15 73. The gaming apparatus of claim 71 in which said first code is in the form of a bar code and said code reading means comprises a bar code reader.

74. The gaming apparatus of claim 71 in which said first code is in the form of a magnetic code on a magnetic strip, and said code reading means comprises a magnetic code reader.

20 75. The gaming apparatus of claim 73 in which said permanent storage record is a card, said card being stored in said gaming apparatus.

76. The gaming apparatus of claim 71 comprising a means for accepting coded coupons.

FIG. 1

2 / 3

FIG. 4

FIG. 3

FIG. 2

3 / 3

FIG. 5a

FIG. 5a is a control panel for a machine. It features a circular logo on the top left. A rectangular box at the top is labeled "MESSAGE AREA". Below this is a numeric keypad with buttons for digits 1 through 9, 0, and a "CLEAR" button. To the right of the numeric keypad are buttons for "ENTER", "CREDIT", "DEPOSIT", and "PRINT". At the bottom are four buttons: "MENU", "DENOMINATION", "RESUME", and "ACCOUNT BALANCE".

FIG. 5b

FIG. 5b is a control panel for selecting denominations. It features a circular logo on the top right. The text "SELECT DENOMINATION" is at the top left. Below it are two columns of buttons for denominations: "\$ 100 \$", "\$ 50 \$", "\$ 25 \$", "\$ 10 \$", "\$ 5 \$" in the left column, and "€ 100 €", "€ 50 €", "€ 25 €", "€ 10 €", "€ 5 €" in the right column. To the right of these is a "PROGRESSIVE" section with "YES" and "NO" buttons. At the bottom left is a "MENU" button, and at the bottom right is an "ACCOUNT BALANCE" button. A small button labeled "BET ALL CREDITS" is located between the denomination buttons and the "MENU" button.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US94/00457

A. CLASSIFICATION OF SUBJECT MATTER

IPC(5) :A63B 71/06

US CL :273/138A

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 273/138A , 138R, 143A, 85CP

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category* | Citation of document, with indication, where appropriate, of the relevant passages | Relevant to claim No. |
|-----------------|--|---|
| X ----- Y | DT, A, 3,406,058, (BISCHOFFSBERGER), 29 August 1985. See entire Abstract. | 6 ----- 1-12, 19, 20, 32, 33, 38-65, 67-76 |
| X ----- Y | US, A, 4,689,742, (TROY ET AL.), 25 August 1987. See entire document. | 13-18, 21-31, 34-37 ----- 1-12, 19, 20, 32, 33, 38-65, 67-76 |
